### Rearranging Atoms Data And Observations

1. Use your atom model kit to construct the reactant molecules for each chemical change below. Then rearrange the atoms to form the product molecules. Add more reactant molecules as needed to form complete product molecules with no left-overs. 2.

Evaluate models of the rearrangement of atoms during a chemical reaction between two elements. Explain observations of reactions in which elements combine in terms of a change in arrangement of atoms resulting in new properties. Use a chemical formula to predict possible products of a thermal decomposition reaction.

### Rearrangement of Atoms | STEM

In this unit, you will build on your model of matter as bonded atoms that combine in definite ratios to include the rearrangement of these atoms to form new substances during chemical reactions. You will continue to relate your observations of the behavior of matter to the microscopic structure and behavior of atoms.

Here's my approach. The advantage of doing it this way is that it's completely programmatic. It's fine to have a solution where you manually rename the variables if the dataset is complete, but this approach can scale to the dataset if you're still adding new stations and gases.

The suggestion that the numbers of atoms of the elements in a given compound always exist in the same ratio is consistent with these observations. For example, when different samples of isooctane (a component of gasoline and one of the standards used in the octane rating system) are analyzed, they are found to have a carbon-to-hydrogen mass ...

3. Atoms combine in simple whole number ratios to form compounds. 4. Atoms of one element cannot change into the atoms of another element--in chemical reactions, they form into new substances. 4 explains the law of the conservation of mass because atoms only rearrange how they are bound, not substances.
